

Serial No. 09/822,653
Amdt. dated November 11, 2005
Reply to Office Action of August 11, 2005

Attorney Docket No. CS10883

Amendments to the Claims:

1. (Currently Amended) A portable electronic device comprising:
a user interface;
a lighting circuit including a light source to illuminate the user interface; and
a control circuit coupled to the lighting circuit, the control circuit having a delayed operation mode wherein:
a first activation of the user interface clears or ignores a user entry so that it is not acknowledged by the user interface, illuminates the user interface, and activates a timer
~~illuminates the user interface without performing any other operation of the device;~~ and
a second activation of the user interface performs an operation of the device,
acknowledged by the user interface, in response to determining that the timer is still activated
~~other than illuminating the user interface.~~
2. (Canceled)
3. (Original) The portable electronic device of claim 1, further comprising a light sensor to determine ambient lighting conditions about the user interface and generate an ambient lighting signal based on the ambient lighting conditions.
4. (Original) The portable electronic device of claim 3, wherein the delayed operation mode is effective when the control circuit determines that the ambient lighting signal is below a minimum illumination level.

Attorney Docket No. CS10883

5. (Original) The portable electronic device of claim 3, wherein the lighting circuit illuminates the user interface for a particular duration when the ambient lighting signal is at a low level and the lighting circuit illuminates the user interface for a shorter duration when the ambient lighting signal is greater than the low level.

6. through 10. (Canceled)

11. (Currently Amended) A The portable electronic device of claim 1, wherein ~~comprising:~~
a user interface;
a lighting circuit including a light source to illuminate the user interface; and
a control circuit coupled to the lighting circuit, the control circuit receives ~~receiving~~ a reverse bias signal generated by the lighting circuit when incident with ambient lighting about the user interface and activating the lighting circuit to illuminate the user interface based on the ambient lighting;

~~wherein a first activation of the user interface illuminates the user interface without performing any other operation of the device and a second activation of the user interface performs an operation of the user interface other than illuminating the user interface.~~

12. (Canceled)

13. (Previous Presented) The portable electronic device of claim 11, wherein the delayed operation mode is effective when the control circuit determines that the ambient lighting is below a minimum illumination level.

14. (Original) The portable electronic device of claim 11, wherein the lighting circuit illuminates the user interface for a particular duration when the ambient lighting is at a low level and the lighting circuit illuminates the user interface for a shorter duration when the ambient lighting is greater than the low level.

15. (Original) The portable electronic device of claim 11, wherein:

the lighting circuit illuminates the user interface for a minimum duration when the ambient lighting is at or above a maximum threshold level;

the lighting circuit illuminates the user interface for a maximum duration when the ambient lighting is below a minimum threshold level; and

the lighting circuit illuminates the user interface for an intermediate duration when the ambient lighting is below the maximum threshold level and at or above the minimum threshold level.

Attorney Docket No. CS10883

16. (Currently Amended) A method of illuminating a user interface of a portable electronic device, ~~the user interface including a display and an input device~~, the method comprising the steps of:

~~determining ambient lighting conditions about the user interface;~~
~~generating an ambient lighting signal based on the ambient lighting conditions; and~~
detecting a first activation of the user interface;
clearing or ignoring a user entry so that it is not acknowledged by the user interface,
illuminating the user interface, and activating a timer in response to detecting the first activation
~~without performing any other operation of the device;~~
detecting a second activation of the user interface;
determining whether the time is still activated in response to detecting the second
activation of the user interface; and
performing an operation of the device, acknowledged by the user interface, in response to
determining that the timer is still activated ~~other than illuminating the user interface.~~

Attorney Docket No. CS10883

17. (Original) The method of claim 16, wherein:

the step of detecting a first activation includes the step of detecting a first activation of the input device;

the step of illuminating includes the step of illuminating the display in response to detecting the first activation without performing any other operation of the device;

the step of detecting a second activation includes the step of detecting a second activation of the input device; and

the step of performing includes the step of performing an operation of the device other than illuminating the display.

18. (Currently Amended) The method of claim 16 further comprising, before the step of detecting the first activation, the step of determining that the ambient lighting conditions are ~~signal is~~ below a minimum illumination level.

19. (Currently Amended) The method of claim 16, wherein the step of illuminating includes the steps of illuminating the user interface for a particular duration when the ambient lighting conditions are ~~signal is~~ at a low level and illuminating the user interface for a shorter duration when the ambient lighting conditions are ~~signal is~~ greater than the low level.

20. (Currently Amended) The method of claim 16, wherein the step of illuminating includes the steps of:

illuminating the user interface for a minimum duration when the ambient lighting ~~conditions are signal is~~ at or above a maximum threshold level;

illuminating the user interface for a maximum duration when the ambient lighting ~~conditions are signal is~~ below a minimum threshold level; and

illuminating the user interface for an intermediate duration when the ambient lighting ~~conditions are signal is~~ below the maximum threshold level and at or above the minimum threshold level.
